杆体的形成 Spinning

用于旋压的原材料都是等径的6063/6060铝合金管材，它是一种优秀的铝合金建筑型材，被广泛的用于建筑铝门窗，幕墙框架等，具有高的抗风压性能、装配性能、抗腐蚀性能和装饰性能。

Raw materials for spinning are aluminum alloy 6063/6060 tube. It is an excellent aluminium alloy widely used for the construction of aluminum windows and doors, curtain wall frame, with high level wind resistance pressure, assembly performance, corrosion resistance and decorative properties.

通过引进的大型全数控旋压设备，原材料在高速旋转的过程中形成锥形或者异形杆。所有的杆体不允许有纵向的焊缝，要求线条流畅，极好的圆整度。

Through large full CNC spinning equipment, raw materials are made into conical or profiled bar in the process of high speed spinning. All the poles do not allow longitudinal welding line, and it requirements smooth lines and excellent roundness.

电器门 Access Door

底座焊接 Welding For Base

4

每个灯杆都有一个用于安装接线盒的电器门。摩尔克斯采用先进的切割设备来切割电器孔的门板，使门成为杆体的一部分，保证电器门的防水性。使用防盗螺丝来安装电器门使之具有防盗能力，同时在灯杆内壁焊接一个“L”工件用于电线接地。

Each pole has a junction box for electric door installation. Morelux adopts advanced cutting equipment to cut the hole door, the door becomes a part of the rod body, ensuring the waterproof of electric door. we use allen key to protect the door, mean time we welding workpiece “L” for the grounding wire.

灯杆的底座采用A356低压浇铸，并进过T6热处理。杆体与底座的焊接全部采用自动焊接设备。焊接质量拥有加拿大焊接局认证。在这个高质量的焊接过程中，焊接的强度及美观度都得以保证。

The base using A356 low pressure casting, and T6 heat treatment, we use automatic welding equipment to connect base and pole. The welding quality has the Canadian welding Bureau certification. In this high quality welding process, the welding strength and beauty are guaranteed.

在185-195温度区间内加热7-8个小时使杆体内分子结构趋于稳定，硬度达到9-11HW。

Heating in the 185-195 temperature interval 7-8 hours

to make the rod body molecular structure tends to be stable, the hardness reaches 9-11HW.

拉丝 Brush

在氧化喷塑之前可以根据客户不同要求将铝杆拉丝成不同粗细的表面。

Before surface finish, we can polish the pole in different thickness to fit customer request.

表面处理 Surface Finishing

7

铝灯杆通常有以下4种表面处理方式：

1. 阳极氧化/电解着色

通过化学的方法在金属的表面产生一层致密的氧化层使之不被腐蚀，适用于海边及盐碱地区。阳极氧化层的标准厚度为15μm，可根据客户需求来增加膜厚。

2. 氟碳喷涂

液态喷涂方式，具有优异的抗褪色性，抗大气污染（酸雨等）的腐蚀性，抗紫外线能力强等特点。

3. 喷塑

粉末喷涂方式，色泽鲜艳、抗紫外线、不褪色。

4. 水转印木纹

通过水压将带有木纹图案的转印纸-塑料膜进行高分子水解使木纹图案依附在灯杆表面。

注意：由于杆体、底板、焊丝等的材质差异，阳极氧化后在焊接的部位会产生一定的色差，这是不可避免的。如果要保证杆体表面颜色的一致性，推荐使用喷塑或者氟碳喷涂的表面处理。

We have four finishing for aluminum poles as following:

1. Anodizing

anodizing is an electrochemical method which creates an oxide layer on the surface of the metal, which is suitable for coastal corrosion areas or salted areas. The standard anodizing coating is 15um, but we can do better according to customer's require.

2. Fluorocarbon coating

A new coating material, it has excellent anti-fade, anti-air polluted(acid rain) corrosion, anti-UV ability.

3. Powder coating

Colored polyester powder coating, it has bright color, anti-ultraviolet radiation, non-fading.

4. Water transfer printing

Through the water pressure to make the wood design enclosed on the pole surface.

Notice: Anodizing inherently results in color variation on aluminum as the material difference between the poles, the base and the welding material, it is inevitable. If you want to ensure the color consistency on surface of poles, powder coating or fluorocarbon coating is recommended.
